The Alien Dilemma: Should We Make Contact?

Last month, scientists at an observatory in Houston detected a strange radio signal coming from a distant star system. It seemed like a message too clever, too well-crafted to be accidental. A big question is now on Earth: Should Earth replay?

I asked several people, and the opinions were divided:

"It's Our Duty to Respond"

Dr. Leila Amed, a researcher in physics, says this is a historic opportunity. She believes the risks are worth it:

"If someone out there is trying to talk to us, staying silent would be a mistake. Communication is the first step to peace and understanding."

"We Should Stay Quiet"

Dr. Allen Queen, a mathematician at MIT, believes that we have to be quiet and don't respond.

"They could see us as a threat, or worse. It's a universe unknown to anyone, we don't know who's listening to us, we'd better leave it at that"

What's Next?

Governments and scientists continue to debate. Should we send a simple greeting? A warning? Or nothing at all?

The signal still repeats. The universe may be listening.
